Q Exploration Questions

For each question, record Q's answer and cross-check against your dashboard.

#	Question Asked	Q's Answer (summarize)	Dashboard Visual Used to Cross-Check	Dashboard Shows	Match?	Notes
1	Which campaign channel has the highest conversion rate?	Based on the Marketing Funnel sheet of your NovaTech Business Performance dashboard, Direct Mail has the highest conversion rate at 47.76% [1].	Marketing Funnel – Total Leads by Funnel Stage and Channel	NovaTech Business Performance-Moamen dashboard, specifically from the Marketing Funnel sheet. The conversion rates were calculated using the " Total Leads by Funnel Stage and Channel " visual, which breaks down distinct lead counts by campaign channel across funnel stages (Lead, Prospect, Qualified Lead, Opportunity, and Closed Won). The conversion rate was derived by dividing the "Closed Won" leads by the total leads for each channel.	Yes	Both matches
2	What is the average deal size by company size?	Small companies have the highest average deal size at \$1,673.52, closely followed by Enterprise at \$1,662.01 — the difference is less than \$12. Large companies have the lowest average deal value at \$1,325.56, which is	Sales Pipeline – Average Deal Value by Company Size	Small companies lead with \$1,673.52 average deal value, closely followed by Enterprise at \$1,662.01. Large companies have the lowest average	Yes	Both matches

		about \$348 less than Small companies. The relatively narrow range across all tiers (~\$348 spread) suggests deal sizing is fairly consistent regardless of company size.		at \$1,325.56 — a potential upselling opportunity. The spread across all tiers is narrow (~\$348), indicating relatively uniform deal sizing.		
3	What is the average resolution time for critical vs. low-priority tickets?	Key Insights Critical tickets are resolved ~1.78 days ahead of schedule, while low-priority tickets are resolved ~2.05 days ahead. - The difference is only 0.27 days (~6.5 hours), suggesting the support team maintains a fairly consistent resolution pace across priority levels. Low-priority tickets are actually resolved slightly faster relative to their due dates, likely because they tend to be simpler issues. - All priority levels are being resolved ahead of schedule, reflecting strong overall support team performance.	Customer Health – Average Resolution Time by Priority	key findings from the "Average Resolution Time by Priority" visual on the Customer Health sheet: Both critical (-1.78 days) and low-priority (-2.05 days) tickets are resolved ahead of schedule. - The gap between them is only 0.27 days (~6.5 hours) — indicating a nearly uniform resolution pace. Low-priority tickets resolve slightly faster, likely due to lower complexity. Critical tickets are the slowest across all priorities, which may signal a need for dedicated fast-track workflows or better resource allocation for urgent issues.	Yes	Both matches

4	What are the top 10 accounts by support ticket volume, and what is their total deal revenue?	Key Highlights • YieldMax Software leads with 334 tickets — nearly double the second-highest account, making it the most support-intensive account. • The top 10 accounts account for 1,514 tickets out of a total of 2,792 (54.2% of all tickets). • Total deal revenue for these top 10 accounts is \$66.00, which is relatively low compared to their high support demand. • 9 out of 10 accounts have a customer sentiment score of 4, while HavenCrest Communications has a slightly lower score of 3. • All top 10 accounts share the same resolution time of 7 days, suggesting a consistent but potentially slow resolution process for high-volume accounts.	Customer Health – At-Risk Accounts by Ticket Volume	from the "At-Risk Accounts by Ticket Volume" visual on the Customer Health sheet: • YieldMax Software leads with 334 tickets — nearly double the next highest account. • The top 10 accounts generate 1,514 tickets (54.2%) of the total 2,792, indicating support demand is heavily concentrated. • Total deal revenue for the top 10 is only \$66.00, which is disproportionately low relative to their high support volume — a potential profitability concern. • 9 out of 10 accounts have a customer sentiment score of 4, with only HavenCrest Communications slightly lower at 3. • All top 10 accounts share a resolution time of 7 days, suggesting a consistent but potentially slow resolution process for high-volume accounts.	Yes	Both matches

5	Are there any campaigns where we spent more than we earned back?	% Key Findings • Every single campaign has a negative ROI — spending significantly exceeds revenue attributed. • Total campaign spend is \$353.5M while total attributed revenue is only \$25.1M, resulting in a massive overall deficit. • Digital Retarget earned the most revenue (\$7.12M) but still lost over \$51.5M. • NovaEdge Awareness is the worst performer, earning only \$209,812 against \$55.4M in spend. • Enterprise Expansion has the smallest net loss at \$44.2M, making it the "least unprofitable" campaign.	Marketing Funnel — Total Campaign Spend vs Revenue	key findings from the "Total Campaign Spend vs Revenue" visual on the Marketing Funnel sheet: • All 6 campaigns are unprofitable — every one spent significantly more than it earned back. • Total spend is \$353.5M vs. only \$25.1M in attributed revenue, a return of just ~7 cents per dollar spent. • Q3 Growth Sprint is the biggest spender at \$75.6M but returned only \$5.0M. • Digital Retarget earned the most revenue (\$7.12M) but still lost over \$51.5M. • NovaEdge Awareness is the worst performer — spending \$55.4M and earning only \$209K in return. • Enterprise Expansion has the smallest net loss at \$44.2M, making it the least unprofitable campaign.	Yes	Both matches

Reflection (include in written summary)

- Where Q Agreed with the Dashboard?
- **Campaign Conversion Efficiency:** Q precisely mirrored the dashboard's Total Leads by Funnel Stage and Channel visual on the Marketing Funnel sheet, identifying **Direct Mail** as the top-converting channel at **47.76%** by dividing Closed Won leads by total leads.
- **Average Deal Value Tiers:** Q matched the Average Deal Value by Company Size visual, confirming that **Small** companies had the highest average deal value at **\$1,673.52**, followed by **Enterprise** at **\$1,662.01**, and **Large** at **\$1,325.56** (showing a tight ~\$348 spread across tiers).
- **Support Ticket Resolution Paces:** Across the Average Resolution Time by Priority visual, Q aligned with the dashboard data showing critical tickets resolved **1.78 days ahead of schedule** and low-priority tickets resolved **2.05 days ahead** (a 0.27-day difference).
- **High-Volume Account Analysis:** Q agreed with the At-Risk Accounts by Ticket Volume chart, accurately surfacing **YieldMax Software** as the leading account (334 tickets), noting the top 10 accounts drove **1,514 out of 2,792 tickets (54.2%)**, and verifying their total deal revenue of **\$66.00**.
- **Campaign Profitability (ROI):** Q fully aligned with the Total Campaign Spend vs Revenue chart, identifying that all campaigns operated at a severe deficit (\$353.5M spend vs. \$25.1M revenue), with **Digital Retarget** generating the highest revenue (\$7.12M) and **NovaEdge Awareness** performing worst (\$209K revenue vs. \$55.4M spend).
- Where Q Disagreed or Struggled (and Why)?
- **Direct Metric Disagreements:** In this exploration, Q produced **no direct calculation or data mismatches** against the dashboard visuals; all five test cases resulted in an exact match.
- **Synthesized Context vs. Operational Context:** Q struggled slightly with business interpretation versus raw descriptive text. For instance, in Ticket Resolution (Question 3), Q emphasized that all tickets were "ahead of schedule" due to negative variance values, whereas an operational dashboard user would immediately flag that critical tickets are the slowest among all tiers and require escalation workflows.
- **Data Nuances and Outliers:** When evaluating Question 4, Q reported a total deal revenue of **\$66.00** for the top 10 accounts without questioning data integrity. While mathematically consistent with the

underlying data visual, natural language engines often struggle to automatically flag obvious logging errors, model discrepancies, or data pipeline bugs unless explicitly prompted.

- **When to Use Q vs. The Dashboard?**

- **Use Amazon QuickSight Q when:**

- **Ad-hoc exploratory questions:** Answering immediate, singular questions (e.g., "*What was our spend on Digital Retarget?*") without navigating multiple sheets and visual filters.
- **Rapid executive summaries:** Generating fast narrative bullet points, high-level totals, and percentages for presentations or ad-hoc stakeholder Slack messages.
- **Broad trend discovery:** Quickly probing across dimensions that are not co-located in a single visual, saving the time required to build custom calculated fields.

- **Use the Dashboard when:**

- **Multi-metric contextual analysis:** Analyzing interconnected operational workflows—such as viewing conversion drop-offs across every stage of the funnel while simultaneously evaluating spend and campaign source.
- **Auditing and anomaly detection:** Verifying unusual data (e.g., extremely low revenue against massive ticket volumes) where visual distribution, outlier points, and table drill-downs are essential.
- **Routine operational monitoring:** Standardized daily or weekly reviews where teams need consistent baseline comparisons, predefined thresholds, and standardized visual benchmarks.
